

To Whom It May Concern:

I work for a rural telecommunications company in South Central Alaska. The majority of our wireless data and mobile phone subscribers live or work in rural areas of the Alaskan bush or in the Prince William Sound (a body of water which is approximately the size of the state of New Jersey.) In many of these places, towers are few and quite far between—due to limited populations and geography. So for the subscribers who live and work in this remote areas, it is vital to install signal boosting amplifiers, provided through Wilson Electronics, in order to carry out business, communicate effectively, and connect to medical and safety personnel, should the need arise.

I highly recommend these booster systems to my subscribers—I find myself either recommending or shipping a booster system about once a week during our busy summer season and almost once a month during the winter months as well. We provide service to the tug boats that work with the safe delivery of oil to the Lower 48, fishing canneries in remote sections of the Sound, rescue services and even some government agencies—all of which rely heavily on amplifiers to provide safe and reliable telecommunication services in the wilds of Alaska.

Thank you for your consideration on this matter.
